A PROCESS FOR PREPARING SYNTHESIS GAS

The present invention relates to a process for preparing synthesis gas by partial oxidation of a hydrocarbon-containing fuel and an oxygen-containing gas in the absence of moderator gas. In particular, liquid or 5 gaseous hydrocarbon-containing fuel is applied.

In such a process for preparing synthesis gas an oxygen-containing gas, which is applied as an oxidiser, and a hydrocarbon-containing fuel are supplied to a gasification zone through a burner comprising an 10 arrangement of passages or channels for fuel and oxidiser, and wherein autothermically a gaseous stream containing synthesis gas is produced under appropriate conditions. The passages or channels are separated from each other by separation walls, the so-called burner 15 internals.

In many known processes for preparing synthesis gas a moderator gas (for example steam, water or carbon dioxide or a combination thereof) is supplied to the gasification zone in order to control the temperature in the 20 gasification zone. Moderator gas may be added to the oxidiser or (gaseous) fuel or may be supplied via a moderator gas passage. Those skilled in the art will know the conditions of applying oxidiser and moderator gas.

Advantageously, a multi-orifice (co-annular) burner 25 comprising a concentric arrangement of n passages or channels co-axial with the longitudinal axis of said burner, wherein n is an integer > 2, is applied.

Such multi-orifice (co-annular) burners contain 30 substantially cylindrical internals which separate the fluid streams flowing through the passages until they reach the burner exit. In particular, such multi-orifice

- 2 -

(co-annular) burners comprise an arrangement of annular concentric channels or passages for supplying oxidiser, moderator gas (optionally) and fuel to the gasification zone.

5 Multi-orifice (co-annular) burners are known as such and the mechanical structures thereof will therefore not be described in detail.

10 Usually such burners comprise a number of slits at the burner outlet and hollow wall members with internal cooling fluid (e.g. water) passages. The passages may or may not be converging at the burner outlet. Instead of comprising internal cooling fluid passages, the burner 15 may be provided with a suitable ceramic or refractory lining applied onto or suspended by a means closely adjacent to the outer surface of the burner (front) wall for resisting the heat load during operation or heat-up/shut down situations of the burner. Advantageously, the exit(s) of one or more passages may be retracted or protruded with respect to the outer passage.

20 It will be appreciated by those skilled in the art that any slit width suitable for the purpose can be applied, dependent on the burner capacity.

25 Advantageously, the central passage has a diameter up to 70 mm, whereas the remaining concentric passages have slit widths in the range of 1-30 mm.

However, it will be appreciated that the present application is not confined to the use of co-annular burners.

30 The oxidiser and the fuel and, optionally, moderator gas are supplied to the gasification zone through the respective channels at specific velocities and mass distribution in order to obtain a good atomization and mixing.

35 Advantageously the respective velocities are measured or calculated at the outlet of the said respective

- 3 -

channels into the gasification zone. The velocity measurement or calculation can be carried out by those skilled in the art in any way suitable for the purpose and will therefore not be described in detail.

5 The oxygen-containing gas, which is applied as oxidiser, is usually air or oxygen or a mixture thereof. An oxidiser comprising at least 95% oxygen is preferred.

10 Synthesis gas is a gas comprising carbon monoxide and hydrogen, and it is used, for example, as a clean medium-calorific value fuel gas or as a feedstock for the synthesis of methanol, ammonia or hydrocarbons, which latter synthesis yields gaseous hydrocarbons and liquid hydrocarbons such as gasoline, middle distillates, lub oils and waxes.

15 In the specification and in the claims the term gaseous (liquid) hydrocarbon-containing fuel will be used to refer to hydrocarbon-containing fuel that is gaseous (liquid) at gasifier feed pressure and temperature.

20 According to an established process, synthesis gas is produced by partially oxidising in a reactor vessel a gaseous fuel such as a gaseous hydrocarbon, in particular petroleum gas or natural gas, at a temperature in the range of from 1000 °C to 1800 °C and at a pressure in the range of from 0.1 MPa to 12 MPa abs. with the use of an oxidiser.

25 Synthesis gas will often be produced near or at a crude oil refinery because the produced synthesis gas can directly be applied as a feedstock for the production of middle distillates, ammonia, hydrogen, methanol or as a fuel gas, for example, for heating the furnaces of the refinery or more efficiently for the firing of gas turbines to produce electricity and heat.

30 For economic reasons it is often desirable to operate the burner without the application of a moderator gas. Further, in order to obtain a good mixing of fuel and

- 4 -

5 oxidiser in the gasifier it is preferred to operate the burner under such conditions that an oxygen blast exists (i.e. the velocity of the oxidiser is substantially larger than the velocity of the fuel at the outlet of the burner). Those skilled in the art will know these conditions.

10 It will be appreciated by those skilled in the art that oxygen blast permits lower fuel supply pressures and enables reduction of compression cost.

15 Usually, the rim of a burner internal (i.e. that part of the burner internal which, when the burner is mounted in a reactor vessel, is directed to the gasification zone and terminates in a tip) is made of steel or low alloy steel.

20 20 However, when applying oxygen blast in the absence of moderator gas it has appeared that the rim(s) of the burner internal(s) separating fuel and oxidiser is (are) severely attacked by metal dusting phenomena so that serious burner damage will occur and the burner lifetime is restricted.

25 Metal dusting is a catastrophic carburization which occurs in industrial plants under conditions of high activity and low oxygen pressure in the temperature range 600-800 °C, leading to decomposition of steels into a mixture of powdery carbon, metal particles and sometimes carbides and oxide. Pitting or general metal wastage is observed, if the corrosion product was carried away by erosion through the gas flow.

30 It is an object of the invention to provide an economically feasible process for preparing synthesis gas which can be carried out over a long period without the need for many shut downs.

The invention therefore provides a process for preparing synthesis gas by partial oxidation of a

- 5 -

hydrocarbon-containing fuel in the absence of moderator gas, comprising the steps of:

supplying a hydrocarbon-containing fuel and an oxidiser through a reactor mix type burner (i.e. wherein the said fuel and said oxidiser each flowing in one or more separate burner passages debouching into the gasification zone, are not mixed until immediately downstream of the said burner passages) to a gasification zone under oxygen blast conditions (i.e. the velocity of the oxidiser is substantially larger than the velocity of the fuel at the outlet of the burner); and wherein at least the rim(s) of the burner internal(s) separating at least at or near its (their) tip(s) said fuel and said oxidiser is (are) made of ceramic material or a noble metal or a noble metal alloy or wherein the rim(s) of the burner internal(s) separating at least at or near its (their) tip(s) said fuel and said oxidiser is (are) provided at its (their) oxidiser side(s) with a lining of ceramic material or noble metal or a noble metal alloy.

The invention further provides a reactor mix type burner to be used in such a process for preparing synthesis gas, said burner comprising an arrangement of at least a fuel burner passage and at least an oxidiser burner passage wherein at least the rim(s) of the burner internal(s) separating at least at or near its (their) tip(s) said fuel passage and said oxidiser passage is (are) made of ceramic material or noble metal or a noble metal alloy or wherein the rim(s) of the burner internal(s) separating at least at or near its (their) tip(s) said fuel passage and said oxidiser passage is (are) provided at its (their) oxidiser side(s) with a lining of ceramic material or noble metal or a noble metal alloy.

Advantageously, the said rim(s) of the said burner internal(s) separating said fuel and said oxidiser is

- 6 -

(are) made of a Pt alloy e.g. Pt/Rh, or Pt/Ir or any ceramic material suitable for the purpose, e.g. SiC (silicon carbide) or Si₃N₄ (silicon nitride).

5 The fuel is e.g. natural gas, which advantageously comprises at least 80% CH₄. Advantageously, the velocity ratio between oxidiser and fuel is:

$$\frac{V_{\text{fuel}}}{V_{\text{oxidiser}}} = 0.25-0.6.$$

More advantageously, the oxidiser velocity is 50-100 m/s and the fuel velocity is 25-60 m/s (provided that the above ratio is satisfied).

10 When applying the process of the invention it has been found that there is no metal dusting and that the burner lifetime is at least 1600 hours.

15 Advantageously the said rim(s) of the said burner internal(s) separating said fuel and said oxidiser has (have) a length of 2-20 mm and a thickness of 0.3-1.0 mm and is (are) mechanically connected in any suitable manner to the burner internal e.g. by welding.

20 In another advantageous embodiment of the invention the rim(s) of the burner internal(s) separating the fuel and the oxidiser is (are) provided with a lining (e.g. a ribbon) at the oxidiser side(s) of the burner internal(s). Such a ribbon may have a length of 5-10 mm and a thickness of 0.2-0.5 mm.

25 The invention will now be described by way of example in more detail by reference to the drawing, in which the figure schematically represents a burner to be used in the process of the invention.

30 Referring to the figure, a partial longitudinal section of a burner having a central passage and an outer passage has been shown schematically. X represents the axis of the burner. The burner debouches into a gasification zone G of a reactor through a refractory

- 7 -

dome. For reasons of clarity the burner has been shown partially only and the reactor details have not been shown. In particular, details of (water)-cooling of the burner have been omitted for reasons of clarity.

5 In the figure a substantially conical burner has been represented but it will be appreciated by those skilled in the art that any shape suitable for the purpose (e.g. substantially cylindrical) is possible.

10 A burner internal rim 1 and its tip 1a have been represented. The rim 1 is made of ceramic material (e.g. SiC or Si_3N_4) or noble metal (e.g. Pt) or a noble metal alloy (e.g. Pt/Rh or Pt/Ir) and is mounted on the burner internal 2 at its end directed to the gasification zone G, e.g. by welding.

15 Through the central passage 3 (diameter e.g. 41 mm) oxidiser is flowing whereas through the outer passage 4 fuel (e.g. natural gas) is flowing. Reference numeral 5 represents the outer passage wall. The slit width of the outer passage 4 is e.g. 25 mm.

20 The arrows A and B representing the velocities of the oxidiser (e.g. 100 m/s) and fuel (e.g. 50 m/s) respectively, indicate that an oxygen blast exists.

The invention will now be described by way of example in more detail by reference to Examples I and II.

25 Example I (oxygen blast).

Flow conditions at the rim between fuel passage and oxidiser passage are considered. The rim is made of Pt. Oxidiser is supplied through a central passage and fuel is supplied through a concentric outer passage.

In Example I the burner was inspected after 2300 hours of operation without moderator gas. No visible damage was detected and the burner was in good condition.

- 10 -

In Example II it appeared that the rim between fuel passage and oxidiser passage was severely attacked after approximately 1000 hours of operation.

Various modifications of the present invention will become apparent to those skilled in the art from the foregoing description. Such modification are intended to fall within the scope of the appended claims.

CLAIMS

1. A process for preparing synthesis gas by partial oxidation of a hydrocarbon-containing fuel in the absence of moderator gas, comprising the steps of:

5 supplying a hydrocarbon-containing fuel and an oxidiser through a reactor mix type burner (i.e. wherein the said fuel and said oxidiser each flowing in one or more separate burner passages debouching into the gasification zone, are not mixed until immediately downstream of the said burner passages) to a gasification zone under oxygen blast conditions (i.e. the velocity of the oxidiser is substantially larger than the velocity of the fuel at the outlet of the burner); and wherein at least the rim(s) of the burner internal(s) separating at least at or near its (their) tip(s) said fuel and said oxidiser is (are) made of ceramic material or noble metal or a noble metal alloy or wherein the rim(s) of the burner internal(s) separating at least at or near its (their) tip(s) said fuel and said oxidiser is (are) provided at its (their) oxidiser side(s) with a lining of ceramic material or noble metal or a noble metal alloy.

9825 9830 9835 9840 9845 9850 9855 9860 9865 9870 9875 9880 9885 9890 9895 9900 9905 9910 9915 9920 9925 9930 9935 9940 9945 9950 9955 9960 9965 9970 9975 9980 9985 9990 9995 9999

4. The process as claimed in any one of claims 1-3, wherein the fuel is gaseous or liquid.

- 12 -

5. The process as claimed in claim 4, wherein the fuel is natural gas.
6. The process as claimed in claim 5, wherein the natural gas comprises at least 80% CH₄.
- 10 7. The process as claimed in any one of claims 1-6, wherein the said rim(s) of the said burner internal(s) separating the said fuel and the said oxidiser is (are) made of a Pt alloy e.g. Pt/Rh or Pt/Ir or made of ceramic material e.g. silicon nitride or silicon carbide.
- 15 8. The process as claimed in any one of claims 1-7, wherein the said rim(s) of the said burner internal(s) separating the said fuel and the said oxidiser has (have) a length of 2-20 mm, and a thickness of 0.3-1.0 mm.
9. The process as claimed in any one of claims 1-8, 15 wherein the burner is a co-annular burner comprising a concentric arrangement of n passages or channels co-axial with the longitudinal axis of said burner, wherein n is an integer > 2.
- 20 10. A reactor mix type burner to be used in the process as claimed in any one of claims 1-9, comprising an arrangement of at least a fuel burner passage and at least an oxidiser burner passage wherein at least the rim(s) of the burner internal(s) separating at least at or near its (their) tip(s) said fuel and said oxidiser is (are) made of ceramic material or noble metal or a noble metal alloy or wherein the rim(s) of the burner internal(s) separating at least at or near its (their) tip(s) said fuel and said oxidiser is (are) provided at its (their) oxidiser side(s) with a lining of ceramic material or noble metal or a noble metal alloy.
- 25 30 11. Synthesis gas whenever obtained by the process as claimed in any one of claims 1-9.

INTERNATIONAL SEARCH REPORT

Intern. Appl. Application No
PCT/EP 96/05733

A. CLASSIFICATION OF SUBJECT MATTER

IPC 6 C01B3/36

According to International Patent Classification (IPC) or to both national classification and IPC

B. FIELDS SEARCHED

Minimum documentation searched (classification system followed by classification symbols)
IPC 6 C01B

Documentation searched other than minimum documentation to the extent that such documents are included in the fields searched

Electronic data base consulted during the international search (name of data base and, where practical, search terms used)

C. DOCUMENTS CONSIDERED TO BE RELEVANT

Category *	Citation of document, with indication, where appropriate, of the relevant passages	Relevant to claim No.

Further documents are listed in the continuation of box C.

Patent family members are listed in annex.

* Special categories of cited documents :

- *'A' document defining the general state of the art which is not considered to be of particular relevance
- *'E' earlier document but published on or after the international filing date
- *'L' document which may throw doubts on priority claim(s) or which is cited to establish the publication date of another citation or other special reason (as specified)
- *'O' document referring to an oral disclosure, use, exhibition or other means
- *'P' document published prior to the international filing date but later than the priority date claimed

- *'T' later document published after the international filing date or priority date and not in conflict with the application but cited to understand the principle or theory underlying the invention
- *'X' document of particular relevance; the claimed invention cannot be considered novel or cannot be considered to involve an inventive step when the document is taken alone
- *'Y' document of particular relevance; the claimed invention cannot be considered to involve an inventive step when the document is combined with one or more other such documents, such combination being obvious to a person skilled in the art.
- *'&' document member of the same patent family

1

Date of the actual completion of the international search

11 March 1997

Date of mailing of the international search report

27.03.97

Name and mailing address of the ISA
European Patent Office, P.B. 5818 Patentzaan 2
NL - 2280 HV Rijswijk
